

Mail Sentry<sup>2</sup> is an integrated suite of secure email and management solutions offered by Mail Sentry, Inc. By integrating a unified set of network protection services, MailSentry<sup>2</sup> offers a comprehensive solution to an array of online threats and issues. Since 1998, Mail Sentry<sup>2</sup> has processed billions of email messages, ensuring data integrity for a diverse community of clients and enterprises. Mail Sentry<sup>2</sup> provides anti-fraud/spam solutions, virus protection and sophisticated network protection tools - all scaled to fit the needs of today's business users.

Mail Sentry<sup>2</sup> offers robust enterprise communications protection and secure email solutions, of which Mail Authentication Protocol (MAP) is a central feature. MAP is an anti-fraud/spam technology exclusively developed and available from Mail Sentry<sup>2</sup>. MAP blocks 100% of email containing false, forged, unverifiable or compromised sender information. Networks using MailSentry<sup>2</sup> and MAP are relieved of the burden of receiving, processing and storing electronic messages and attachments all of which a business neither sought nor desires to receive. In addition to MAP technology, MailSentry<sup>2</sup> incorporates the industry leader, Trend Micro virus screening, to ensure that the most current protections are available against viruses, worms and trojans.

External defenses ensure your network is protected. MailSentry<sup>2</sup> protects client networks at their perimeters by preventing the introduction of viruses and from ever receiving malicious or unwanted emails. By securing the network from the outside, MailSentry<sup>2</sup> protects your organization's email infrastructure, improves enterprise email performance by ensuring users only receive valid email messages and raises the overall efficiency of a network by lowering bandwidth needs, conserving server capacity and lowering overall IT costs.
